

INFLUENZA TRIGGERED HIS HEART ATTACK

John considered himself in good health and thought that his infection would be over soon. He believed he just had a bad cold with a bit of fever and muscle pain.

Within a few days of catching influenza he had a **HEART ATTACK.***

One Scottish study observed that influenza can trigger severe cardiovascular complications in the few days[†] following an influenza infection:¹

10x

the risk of suffering
from a first
HEART ATTACK.^{†1}

8x

the risk of suffering
from a first
STROKE.^{†1}

Vaccination is the most effective way to protect against influenza.^{2,3}
